My Work

WYA

**Let's Survey the Project
Landscape**

Tim Ekl

@timothyekl

I'd love to see a [#nextcoders](#) talk (lightning or otherwise) that just has a Venn diagram of Xcode project, scheme, target, workspace, etc.

Target

Target

- Inputs
 - Source files
 - Build settings
 - Build phases
 - Capabilities
- Outputs
 - Application, dynamic framework, static library, extension...

Scheme

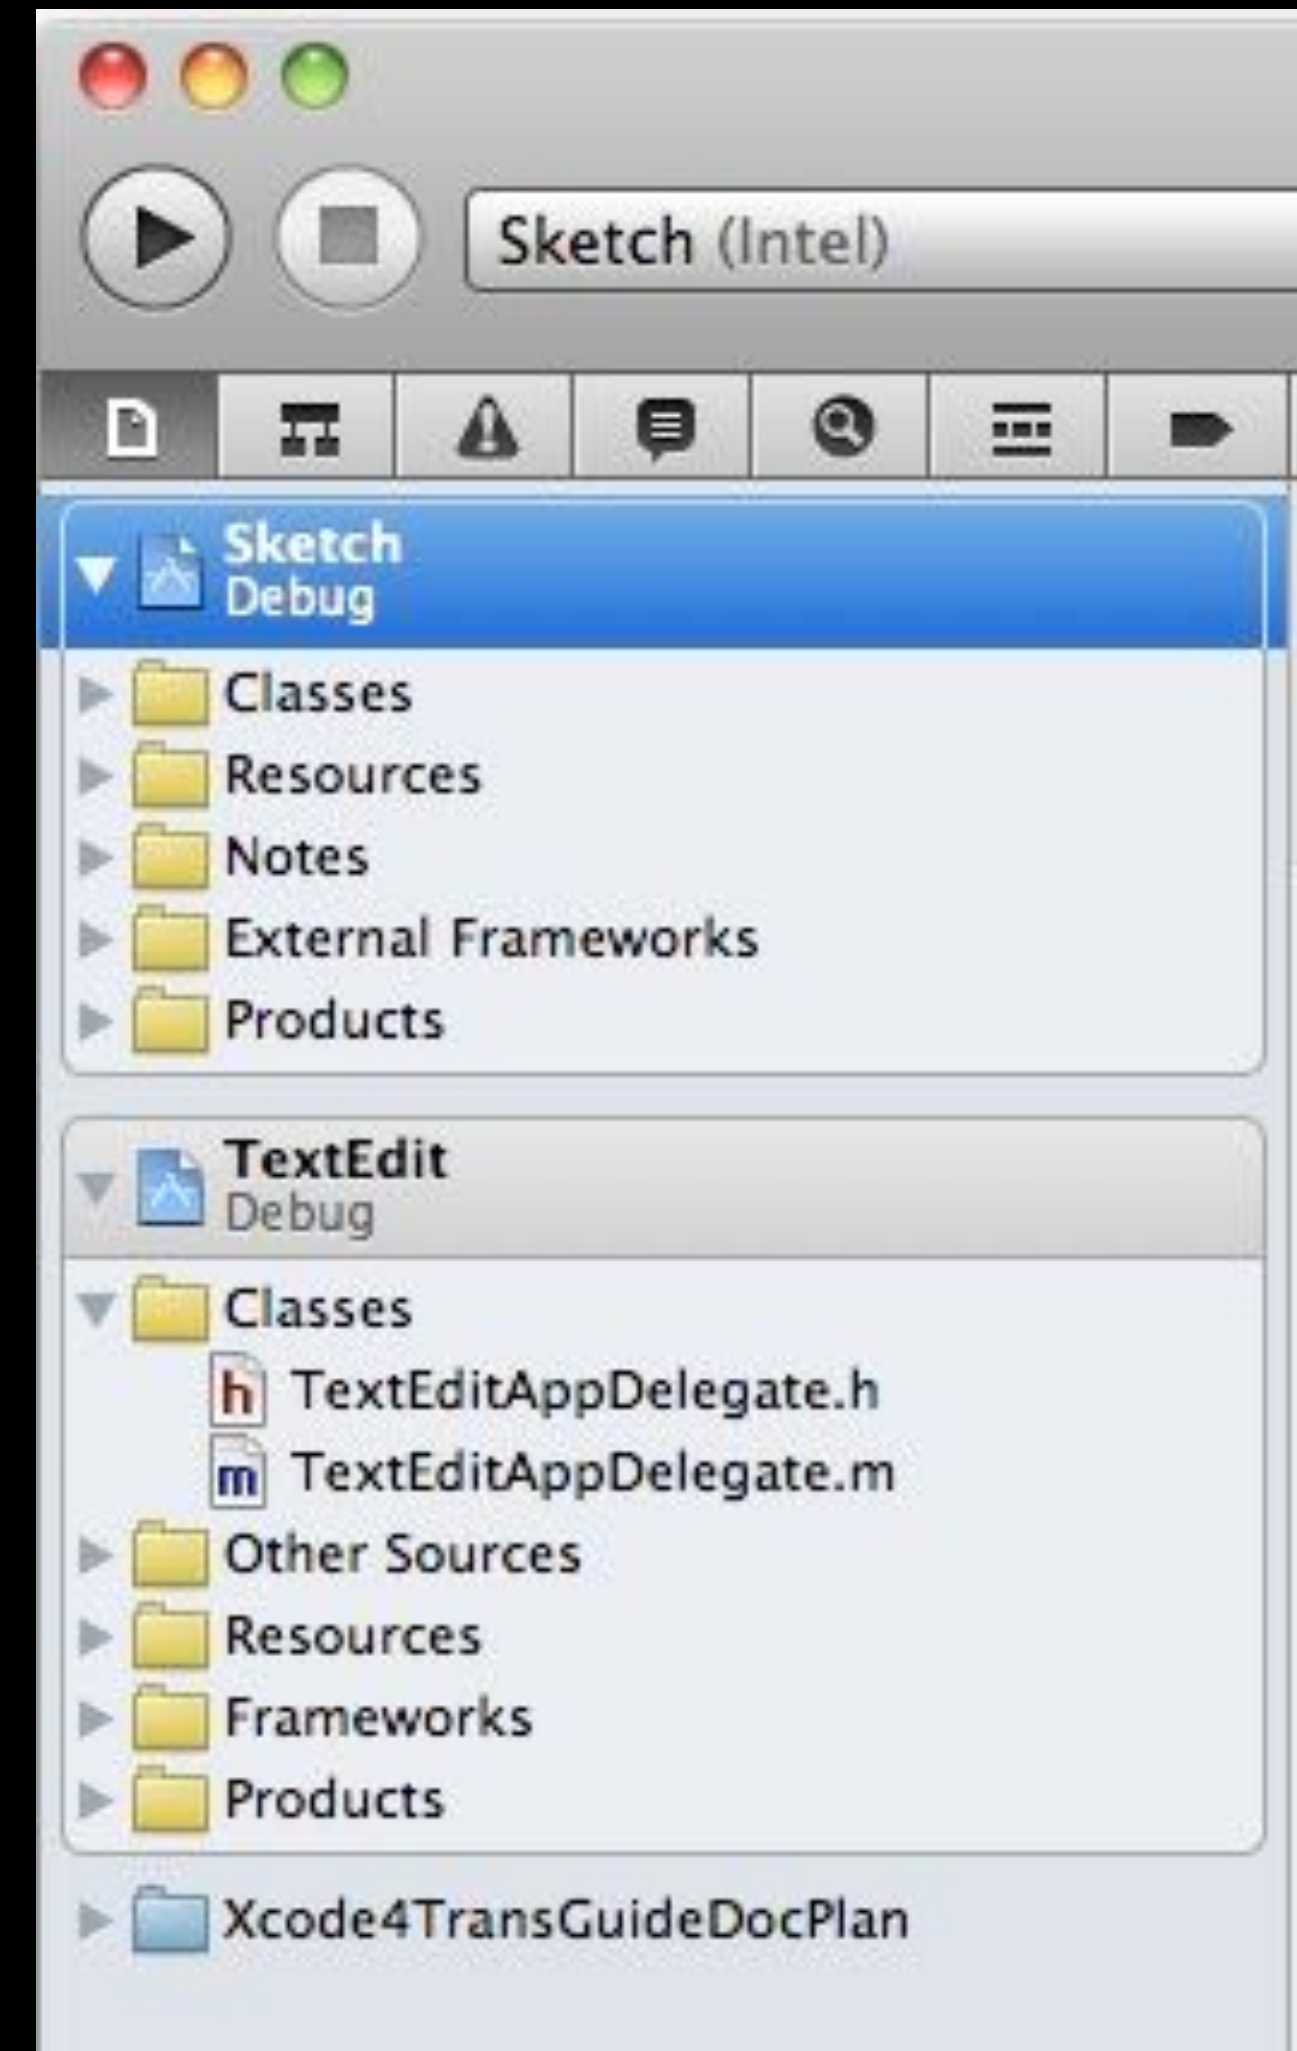

- Associated with a target
- Responsible for doing the building, running, testing of its target
- Applies configurations
 - debug & release are standards
- Determines which tests run
- Applies diagnostics such as sanitizers

Project

- Target management
 - Source files, build settings, extra resources
- Scheme management
- Can invoke the build process
- Run tests
- Syntax highlighting
- Indexing
- Much more

Workspace

- Work with multiple projects at a time
- Most common in things like CocoaPods

Framework

Resources

- WWDC 2018: Behind the Scenes of the Xcode Build Process
 - <https://developer.apple.com/videos/play/wwdc2018/415/>

December, 2017

“We don’t check in Xcode projects”

-iOS co-worker at Lyft

Generating Xcode Projects

- XcodeGen
 - <https://github.com/yonaskolb/XcodeGen>
 - Define your project in yml or json files
- Swift Package Manager
 - `swift package generate-xcodeproj`
 - Define your project in the Package.swift manifest

Why do this?

- Groups and files in Xcode are always in sync with the filesystem
 - Great Developer Habits, WWDC 2019
 - <https://developer.apple.com/videos/play/wwdc2019/239/>
- Human readable project configurations stored in source control
- One less file to worry about in source control and code reviews
- No more merge conflicts in project files

**“Only 123 lines of conflict in my project file.
Rather, blocks of conflicts.
Probably a couple thousand lines.
On the other hand, I know what I’m doing today.”**

-Beleaguered Developer

XcodeGen Primer

The Project Spec

```
Repo Root
|-- project.yml
|-- Modules
|   |-- App
|       |-- Sources
|           |-- Main.swift
|           |-- // other sources
|       |-- xcconfigs
|-- DataModel
|   |-- Sources
|       |-- Contact.swift
|       |-- xcconfigs
```

The Project Spec

```
name: MyContactApp
options:
  bundleIdPrefix: com.myapp
targets:
  MyContactApp:
    type: application
    platform: iOS
    deploymentTarget: "10.0"
    sources: [Modules/App/Sources]
    dependencies:
      - target: DataModel
      - sdk: Contacts.framework
    configFiles:
      Debug: xcconfigs/App-Debug.xcconfig
      Release: xcconfigs/App-Release.xcconfig
  DataModel:
    type: framework
    platform: iOS
    sources: [Modules/DataModel/Sources]
    configFiles:
      Debug: xcconfigs/DataModel-Debug.xcconfig
      Release: xcconfigs/DataModel-Release.xcconfig
```

```
Repo Root
|-- project.yml
|-- Modules
|   |-- App
|       |-- Sources
|           |-- Main.swift
|           |-- // other sources
|       |-- xcconfigs
|-- DataModel
|   |-- Sources
|       |-- Contact.swift
|   |-- xcconfigs
```

Breaking Up

```
name: MyContactApp
include:
  - Modules/App/app.yml
  - Modules/DataModel/DataModel.yml

// Modules/DataModel.yml
targets:
  DataModel:
    type: framework
    platform: iOS
    sources:
      - path: Sources
        name: DataModel
    configFiles:
      Debug: xcconfigs/DataModel-Debug.xcconfig
      Release: xcconfigs/DataModel-Release.xcconfig
```

Breaking Up

```
name: MyContactApp
include:
  - Modules/App/app.yml
  - Modules/DataModel/DataModel.yml
  - Modules/Networking/Networking.yml

// Modules/DataModel.yml
targets:
  DataModel:
    type: framework
    platform: iOS
    sources:
      - path: Sources
        name: DataModel
    configFiles:
      Debug: xcconfigs/DataModel-Debug.xcconfig
      Release: xcconfigs/DataModel-Release.xcconfig

// Modules/Networking.yml
targets:
  Networking:
    type: framework
    platform: iOS
    sources:
      - path: Sources
        name: Networking
    configFiles:
      Debug: xcconfigs/Networking-Debug.xcconfig
      Release: xcconfigs/Networking-Release.xcconfig
```

Target Templates

```
targetTemplates:
  Framework:
    type: framework
    platform: iOS
    configFiles:
      Debug: Modules/${target_name}/xcconfigs/${target_name}-Debug.xcconfig
      Release: Modules/${target_name}/xcconfigs/${target_name}-Release.xcconfig
    sources:
      - path: Modules/${target_name}/Sources
        name: ${sourceName}

// Updated Modules/DataModel/DataModel.yml
targets:
  DataModel:
    templates:
      - Framework
    templateAttributes:
      sourceName: AwesomeFramework
```

Schemes

- Auto-generated for each target
- Target scheme
 - Add test targets
 - Supply your own config variants (other than debug/release)
 - Add pre/post actions
 - Cannot rename the scheme from the default
- Project scheme
 - Allows for additional control than a target scheme
 - Can fully configure the scheme like you can in Xcode's scheme editor

Workflow Integration

- Installation
 - Mint (package manager for Swift CLI tools)
 - Homebrew
 - Download and run make
 - Specify a version and let a script handle it (👍)
- Triggering
 - `xcodegen generate`
 - Use as part of an automated process

iOS Project Template

<https://github.com/jsorge/ios-project-template>

Executable File | 36 lines (27 sloc) | 808 Bytes

Raw Blame History   

```
1  #!/usr/bin/env bash
2
3  set -e
4  set -o pipefail
5  set -u
6
7  required_version="$(cat .xcodegen-version)"
8  install_location=./vendor
9
10 install() {
11     if [ ! -d $install_location ]; then
12         mkdir $install_location;
13     fi;
14
15     rm -f ./tmp/XcodeGen ./tmp/xcodegen.tar.gz
16
17     curl --location --fail --retry 5 \
18         https://github.com/yonaskolb/XcodeGen/releases/download/"$required_version"/xcodegen.zip \
19         --output $install_location/xcodegen.zip
20
21     (
22         cd $install_location
23         unzip -o xcodegen.zip -d download > /dev/null
24         mv download/xcodegen/bin/xcodegen XcodeGen
25         rm -rf xcodegen.zip download
26     )
27
28     echo "Installed XcodeGen locally"
29 }
30
31 if [ ! -x $install_location/XcodeGen ]; then
32     install
33 elif ! diff <(echo "Version: $required_version") <($install_location/XcodeGen version) > /dev/null; then
34     install
35 fi
```

Using Make

In your Makefile:

```
.PHONY: project
project:
    @./tools/ensure-xcodegen.sh
    ./vendor/XcodeGen generate
```

Default

⌘⌘1

Gray-Ghost:Scorebook  11.0 [xcode-11 +]\$

Pain Points

- When you do a pull, merge, or otherwise get changes from upstream you'll have to re-make your project
- Xcode sometimes doesn't like the project file changing from underneath it
 - Script closing project, re-making, and re-opening the project
- CI setup may be more complicated if your CI provider assumes a project is checked in for setting their service up
 - In a post-checkout CI step, run your project generation command

Next Steps

- Move your build settings to xcconfig files, don't put any in your project
 - Olof's Xcoders xcconfig talk
 - <https://vimeo.com/274817680>
 - James Dempsey's Build Settings Extractor Mac App
 - <https://github.com/dempseyatgithub/BuildSettingExtractor>
- Delete the project file from your repo, add `*.xcodproj` to your git ignore file

Daniel Duan
@daniel_duan

1. put all Xcode build settings into xcconfigs
(github.com/dempseyatgithu...)
2. set up XcodeGen (github.com/yonaskolb/Xcod...)
3. delete and git ignore .xcodproj
4. enlightenment
